

### Starting and Stopping

octave <code>--gui</code>	start Octave CLI/GUI session
octave <code>file</code>	run Octave commands in <code>file</code>
octave <code>--eval code</code>	evaluate <code>code</code> using Octave
octave <code>--help</code>	describe command line options
quit or exit	exit Octave
Ctrl-C	terminate current command and return to top-level prompt

### Getting Help

help <code>command</code>	briefly describe <code>command</code>
doc	use Info to browse Octave manual
doc <code>command</code>	search for <code>command</code> in Octave manual
lookfor <code>str</code>	search for <code>command</code> based on <code>str</code>

### Command Completion and History

TAB	complete a command or variable name
Alt-?	list possible completions
Ctrl-r Ctrl-s	search command history

### Directory and Path Commands

cd <code>dir</code>	change working directory to <code>dir</code>
pwd	print working directory
ls <code>[options]</code>	print directory listing
what	list .m/.mat files in the current directory
path	search path for Octave functions
pathdef	default search path
addpath <code>(dir)</code>	add a directory to the path
getenv <code>(var)</code>	value of environment variable

### Package Management

Add-on packages are independent of core Octave, listed at <https://packages.octave.org/>

pkg install <code>-forge pkg</code>	download and install <code>pkg</code>
pkg install <code>file.tar.gz</code>	install pre-downloaded package file
pkg list	show installed packages
pkg load / pkg unload	load/unload installed package
statistics optimization	various common packages
control signal image	
symbolic etc.	

### Matrices

Square brackets delimit literal matrices. Commas separate elements on the same row. Semicolons separate rows. Commas may be replaced by spaces, and semicolons may be replaced by newlines. Elements of a matrix may be arbitrary expressions, assuming all the dimensions agree.

<code>[ x, y, ... ]</code>	enter a row vector
<code>[ x; y; ... ]</code>	enter a column vector
<code>[ w, x; y, z ]</code>	enter a 2×2 matrix
rows columns	number of rows/columns of matrix
zeros ones	create matrix of zeros/ones
eye diag	create identity/diagonal matrix
rand randi randn	create matrix of random values
sparse spalloc	create a sparse matrix
all	true if all elements nonzero

any	true if at least one element nonzero
nnz	number of nonzero elements

### Multi-dimensional Arrays

ndims	number of dimensions
reshape squeeze	change array shape
resize	change array shape, lossy
cat	join arrays along a given dimension
permute ipermute	like N-dimensional transpose
shiftdim	
circshift	cyclically shift array elements
meshgrid	matrices useful for vectorization

### Ranges

Create sequences of real numbers as row vectors.

<code>base : limit</code>	
<code>base : incr : limit</code>	
<code>incr == 1</code>	if not specified. Negative ranges allowed.

### Numeric Types and Values

Integers saturate in Octave. They do not roll over.

int8 int16 int32 int64	signed integers
uint8 uint16 uint32	unsigned integers
uint64	
single double	32-bit/64-bit IEEE floating point
intmin intmax flintmax	integer limits of given type
realmin realmax	floating point limits of given type
inf nan NA	IEEE infinity, NaN, missing value
eps	machine precision
pi e	3.14159..., 2.71828...
i j	$\sqrt{-1}$

### Strings

A *string constant* consists of a sequence of characters enclosed in either double-quote or single-quote marks. Strings in double-quotes allow the use of the escape sequences below.

<code>\\</code>	a literal backslash
<code>\"</code>	a literal double-quote character
<code>\'</code>	a literal single-quote character
<code>\n</code>	newline, ASCII code 10
<code>\t</code>	horizontal tab, ASCII code 9
sprintf sscanf	formatted IO to/from string
strcmp	compare strings
strcat	join strings
strfind regexp	find matching patterns
strrep regexprep	find and replace patterns

### Index Expressions

<code>var(idx)</code>	select elements of a vector
<code>var(idx1, idx2)</code>	select elements of a matrix
<code>var([1 3], :)</code>	rows 1 and 3
<code>var(:, [2 end])</code>	the second and last columns
<code>var(1:2:end, 2:2:end)</code>	get odd rows and even columns
<code>var1(var2 == 0)</code>	elements of <code>var1</code> corresponding to zero elements of <code>var2</code>
<code>var(:)</code>	all elements as a column vector

### Cells, Structures, and Classdefs

<code>var{idx} = ...</code>	set an element of a cell array
cellfun <code>(f, c)</code>	apply a function to elements of cell array
<code>var.field = ...</code>	set a field of a structure
fieldnames <code>(s)</code>	returns the fields of a structure
structfun <code>(f, s)</code>	apply a function to fields of structure
classdef	define new classes for OOP

### Assignment Expressions

<code>var = expr</code>	assign value to variable
<code>var(idx) = expr</code>	only the indexed elements are changed
<code>var(idx) = []</code>	delete the indexed elements

### Arithmetic Operators

If two operands are of different sizes, scalars and singleton dimensions are automatically expanded. Non-singleton dimensions need to match.

<code>x + y, x - y</code>	addition, subtraction
<code>x * y</code>	matrix multiplication
<code>x .* y</code>	element-by-element multiplication
<code>x / y</code>	right division, conceptually equivalent to <code>(inverse (y') * x')</code>
<code>x ./ y</code>	element-by-element right division
<code>x \ y</code>	left division, conceptually equivalent to <code>inverse (x) * y</code>
<code>x .\ y</code>	element-by-element left division
<code>x ^ y</code>	power operator
<code>x .^ y</code>	element-by-element power operator
<code>+= -= *= ./=</code>	in-place equivalents of the above operators
<code>./= \= .\= ^= .^=</code>	
<code>-x</code>	negation
<code>+x</code>	unary plus (a no-op)
<code>x'</code>	complex conjugate transpose
<code>x.'</code>	transpose
<code>++x --x</code>	increment / decrement, return <i>new</i> value
<code>x++ x--</code>	increment / decrement, return <i>old</i> value

### Comparison and Boolean Operators

These operators work on an element-by-element basis. Both arguments are always evaluated.

<code>&lt; &lt;= == &gt;= &gt;</code>	relational operators
<code>!= ~=</code>	not equal to
<code>&amp;</code>	logical AND
<code> </code>	logical OR
<code>! ~</code>	logical NOT

### Short-circuit Boolean Operators

Operators evaluate left-to-right. Operands are only evaluated if necessary, stopping once overall truth value can be determined. Non-scalar operands are converted to scalars with **all**.

<code>x &amp;&amp; y</code>	logical AND
<code>x    y</code>	logical OR

Operator Precedence

Table of Octave operators, in order of **decreasing** precedence.

<code>() {} .</code>	array index, cell index, structure index
<code>' , ' ^ . ^</code>	transpose and exponentiation
<code>+ - ++ -- !</code>	unary minus, increment, logical “not”
<code>* / \ .* ./ .\</code>	multiplication and division
<code>+ -</code>	addition and subtraction
<code>:</code>	colon
<code>&lt; &lt;= == &gt;= &gt; !=</code>	relational operators
<code>&amp;  </code>	element-wise “and” and “or”
<code>&amp;&amp;   </code>	logical “and” and “or”
<code>= += -= *= /= etc.</code>	assignment, groups left to right
<code> ; ,</code>	statement separators

General programming

endfor, endwhile, endif etc. can all be replaced by end.

<code>for x = 1:10</code>	for loop
<code>endfor</code>	
<code>while (x &lt;= 10)</code>	while loop
<code>endwhile</code>	
<code>do</code>	do-until loop
<code>until (x &gt; 10)</code>	
<code>if (x &lt; 5)</code>	if-then-else
<code>elseif (x &lt; 6)</code>	
<code>else</code>	
<code>endif</code>	
<code>switch (tf)</code>	switch-case
<code>case "true"</code>	
<code>case "false"</code>	
<code>otherwise</code>	
<code>endswitch</code>	
<code>break</code>	exit innermost loop
<code>continue</code>	go to start of innermost loop
<code>return</code>	jump back from function to caller
<code>try</code>	cleanup only on exception
<code>catch</code>	
<code>unwind_protect</code>	cleanup always
<code>unwind_protect_cleanup</code>	

Functions

`function [ret-list =] function-name [ (arg-list) ]`  
    `function-body`  
`endfunction`

*ret-list* may be a single identifier or a comma-separated list of identifiers enclosed by square brackets.

*arg-list* is a comma-separated list of identifiers and may be empty.

Function Handles and Evaluation

<code>@func</code>	create a function handle to <i>func</i>
<code>@(vars) expr</code>	define an anonymous function
<code>str2func func2str</code>	convert function to/from string
<code>functions (handle)</code>	Return information about a function handle

<code>f (args)</code>	Evaluate a function handle <i>f</i>
<code>feval</code>	Evaluate a function handle or string
<code>eval (str)</code>	evaluate <i>str</i> as a command
<code>system (cmd)</code>	execute arbitrary shell command string

Anonymous function handles make a copy of the variables in the current workspace at the time of creation.

Global and Persistent Variables

`global var = ...` declare & initialize global variable  
`persistent var = ...` persistent/static variable  
Global variables may be accessed inside the body of a function without having to be passed in the function parameter list provided that they are declared global when used.

Common Functions

<code>disp</code>	display value of variable
<code>printf</code>	formatted output to <b>stdout</b>
<code>input scanf</code>	input from <b>stdin</b>
<code>who whos</code>	list current variables
<code>clear pattern</code>	clear variables matching pattern
<code>exist</code>	check existence of identifier
<code>find</code>	return indices of nonzero elements
<code>sort</code>	return a sorted array
<code>unique</code>	discard duplicate elements
<code>sortrows</code>	sort whole rows in numerical or lexicographic order
<code>sum prod</code>	sum or product
<code>mod rem</code>	remainder functions
<code>min max range mean</code>	basic statistics
<code>median std</code>	

Error Handling, Debugging, Profiling

<code>error (message)</code>	print message and return to top level
<code>warning (message)</code>	print a warning message
<code>debug</code>	guide to all debugging commands
<code>profile</code>	start/stop/clear/resume profiling
<code>profshow</code>	show the results of profiling
<code>profexplore</code>	

File I/O, Loading, Saving

<code>save load</code>	save/load variables to/from file
<code>save -binary</code>	save in binary format (faster)
<code>dlmread dlmwrite</code>	read/write delimited data
<code>csvread csvwrite</code>	read/write CSV files
<code>xlsread xlswrite</code>	read/write XLS spreadsheets

<code>fopen fclose</code>	open/close files
<code>fprintf fscanf</code>	formatted file I/O
<code>textscan</code>	
<code>fflush</code>	flush pending output

Math Functions

Run `doc <function>` to find related functions.

<code>cov corrcoef</code>	covariance, correlation coefficient
<code>tan tanh atan2</code>	trig and hyperbolic functions
<code>cross curl del2</code>	vector algebra functions

<code>det inv</code>	determinant matrix inverse
<code>eig</code>	eigenvalues and eigenvectors
<code>norm</code>	vector norm, matrix norm

<code>rank</code>	matrix rank
<code>qr</code>	QR factorization
<code>chol</code>	Cholesky factorization
<code>svd</code>	singular value decomposition

<code>fsolve</code>	solve nonlinear algebraic equations
<code>lsode ode45</code>	integrate nonlinear ODEs
<code>dassl</code>	integrate nonlinear DAEs
<code>integral</code>	integrate nonlinear functions

<code>union</code>	set union
<code>intersection</code>	set intersection
<code>setdiff</code>	set difference

<code>roots</code>	polynomial roots
<code>poly</code>	matrix characteristic polynomial
<code>polyder polyint</code>	polynomial derivative or integral
<code>polyfit polyval</code>	polynomial fitting and evaluation
<code>residue</code>	partial fraction expansion
<code>legendre bessell</code>	special functions

<code>conv conv2</code>	convolution, polynomial multiplication
<code>deconv</code>	deconvolution, polynomial division

<code>fft fft2 ifft(a)</code>	FFT / inverse FFT
<code>freqz</code>	FIR filter frequency response
<code>filter</code>	filter by transfer function

Plotting and Graphics

<code>plot plot3</code>	2D / 3D plot with linear axes
<code>line</code>	2D or 3D line
<code>patch fill</code>	2D patch, optionally colored
<code>semilogx semilogy loglog</code>	logarithmic axes
<code>bar hist</code>	bar chart, histogram
<code>stairs stem</code>	stairs and stem graphs
<code>contour</code>	contour plot
<code>mesh trimesh surf</code>	plot 3D surfaces

<code>figure</code>	new figure
<code>hold on</code>	add to existing figure
<code>title</code>	set plot title
<code>axis</code>	set axis range and aspect
<code>xlabel ylabel zlabel</code>	set axis labels
<code>text</code>	add text to a plot
<code>grid legend</code>	draw grid or legend

<code>image imagesc spy</code>	display matrix as image
<code>imwrite saveas print</code>	save figure or image
<code>imread</code>	load an image
<code>colormap</code>	get or set colormap
